## Notes

This is a sample report generated from fictional Slack data. Names, channels, and messages are illustrative. The math, rounding, evidence hashes, and layout are exactly what OvertimeLog produces for real billing weeks.

---

SHA256 hashes were computed at capture time from the string `USER_ID|SLACK_TIMESTAMP|FULL_MESSAGE_TEXT`. They protect against local tampering: re-computing the hash from the raw data should produce the same value. If a message was edited or deleted in Slack after capture, the hash still matches the originally captured content. To verify: `echo -n "USER_ID|TS|TEXT" | sha256sum` (Linux/Mac) or `python -c "import hashlib; print(hashlib.sha256(b'...').hexdigest())"`.  
Sample report — built from seeded data using the actual OvertimeLog export code. Not a real bill. | 2026-04-25 21:15
